Lab 4: Vibe Coding chat history

Student: Pranaav Prabhakaran (PES1UG24AM387), Section G, Serial 26
Assigned repo: https://github.com/SETAPESU26/26_bubbleBobble
LLM: Claude (Claude Code), session https://claude.ai/code/session_01J5uNVCeWuuPFAvYLVshZ19
Date: 9 October 2026

PROMPT 1 (USER)

[Uploaded the Lab 4 Vibe Coding handout PDF and the Section G assignment spreadsheet.]

CLAUDE

Read both files. The handout asks for: clone the assigned repo, record 10 s before, fix the bug, add each README feature, record 10 s after, separate commits per task, and upload videos, code and chat history to a Lab-4 folder in the student's own repo. Asked which repo was the student's.

PROMPT 2 (USER)

https://github.com/Pranaav3007/PES1UG24AM387_PRANAAV-

CLAUDE

Matched the student to serial 26, cloned **SETAPESU26/26_bubbleBobble** and read the README: one deliberate bug and three features left as empty functions.

- Task 1: fix the bubble-trapping bug
- Task 2: implement `bubble_tint(bubble)`
- Task 3: implement `on_fruit_collected(fruit)`
- Task 4: implement `bonus_life_threshold()`

Copied the original code into `Lab-4/` and committed it, then recorded a 10 s **before** video of the unmodified game.

Task 1, the bug. In `trap_enemies`, a squared distance was compared against `24 * 2` (48), so a bubble had to be within about 7 px to trap an enemy. Fix:

```
- if bubble.pos.distance_squared_to(enemy.center) < 24 * 2:
+ if bubble.pos.distance_squared_to(enemy.center) < 24 ** 2:
```

Verified: a bubble 18 px from an enemy did not trap it before the fix and does after.

Task 2, bubble_tint. Bubbles with a trapped enemy fade from pink to red as `bubble.life` runs out, and flash white in the last 2 seconds; empty bubbles keep the default colour.

```
def bubble_tint(bubble):
    if bubble.enemy is None:
        return None
    t = max(0.0, min(1.0, bubble.life / BUBBLE_LIFE))
    if bubble.life < 2.0 and int(bubble.life * 8) % 2 == 0:
        return (255, 255, 255)
    return (255, int(60 + 130 * t), int(60 + 170 * t))
```

Task 3, on_fruit_collected. Collecting a fruit adds to a "Fruit" counter in the HUD and emits a burst of 14 yellow sparkles. Sparkles are updated in `update()`, drawn in `draw()`, and both reset with the game.

```
def on_fruit_collected(fruit):
    FRUIT_STATS["collected"] += 1
    for _ in range(14):
        velocity = pygame.Vector2(random.uniform(60, 180), 0).rotate(random.uniform(0, 360))
        SPARKLES.append([pygame.Vector2(fruit.center), velocity, 0.6])
```

Task 4, bonus_life_threshold. Returns `5000`; the existing bookkeeping awards one life per 5,000 points. Verified: score 5,100 gives 4 lives.

Recorded a 10 s **after** video (score starts at 4,900 and the demo player cannot die, so the bonus life appears within 10 s). Each task is a separate commit. Pushing to the student's repo failed because the session had no write access; the files were delivered as a zip.

PROMPT 3 (USER)

requirements are 2 videos llm chatexport github repo link

CLAUDE

Confirmed the deliverables: before and after videos (done), this chat export as a PDF (this document), and the GitHub repo link, which needs the Lab-4 commits pushed to https://github.com/Pranaav3007/PES1UG24AM387_PRANAAV-.
